

**AUTOMATIC HANDLING OF INCOMING COMMUNICATIONS
AT A WIRELESS DEVICE**

ABSTRACT OF THE DISCLOSURE

[0030] A wireless computer device, such as a mobile telephone, that receives attempted communication connections, such as phone calls, across a wireless network and can respond thereto without the user directly entering the communication. The wireless device classifies the attempted communication connection, such as through receipt of Caller ID, and performs a predetermined response to a communication connection attempt based upon the classification, such as blocking the call, answering with a prerecorded message, or sending data to the calling device.
